Mismatch in components.

Systematic mismatch :

- \diamondsuit Predicatble variations in component values.
- \diamond Gradients across the chip.
- \Leftrightarrow Fabrication gradients.
- \diamond Temperature gradients.
- \diamond Usually assumed to be linear.

Common centroid arrangement.

 \diamondsuit The components that need to be matched must have a common centroid

 \diamond But leads to a more complicated layout.

- $\diamond C = C'_A A + C_P P;$
- $\diamond C_P \Rightarrow$ fringe capacitance per unit length.
- \diamondsuit Dummy devices for identical surroundings.
- \Rightarrow Ratios = no. of identical units.

Noise : Random noise variations in the current(voltage) due to the discreate ness of the current and their random motion.

Thermal noise current i(t); is uncorellated from instant to instant and from component to component.

 $i_n(t)$ = Value at each instant is random white noise.

(i.e.... Power spectral density is uniform.)

<u>Resistance : Thermal noise current.</u>

$$R \geq \underbrace{i_{n}}_{n} = \frac{4kT}{R} \quad \underbrace{i_{n}}_{R} \approx \underbrace{i_{n}}_{r} R$$
$$V = i_{n}R$$
